

A photograph of a modern parking garage. The scene is filled with a series of concrete pillars that recede into the distance, creating a strong sense of perspective. The floor is a smooth, light-colored concrete. Several cars are parked in the bays, including a bright yellow sports car and a silver sedan. The lighting is soft and even, highlighting the textures of the concrete and the sleek lines of the vehicles.

VIBRATION ISOLATION SOLUTIONS

AMORIM CORK COMPOSITES

CORK, AN EXCEPTIONAL RAW MATERIAL

Cork is the outer bark of the cork oak tree (*Quercus Suber L.*), the 100% natural plant tissue covering the trunk and branches.

It consists of a honeycomb-like structure of microscopic cells filled with an air-like gas and composed mainly with suberin, lignin, and polysaccharides. One cubic centimetre of cork contains about 40 million cells.

Cork is also known as "nature's foam" due to its alveolar cellular structure. It has a closed-cell structure making it lightweight.

It is sustainably harvested by specialised professionals without damaging the trunk, thus enabling the tree to grow another layer of outer bark that, in time, will be re-harvested. Over the course of the cork oak tree's life, that lasts 200 years on average, the cork may be stripped around 17 times. This means that cork is not only a natural raw material, it is also renewable and recyclable.

KEY FEATURES

Excellent
acoustic insulator

Excellent
thermal insulator

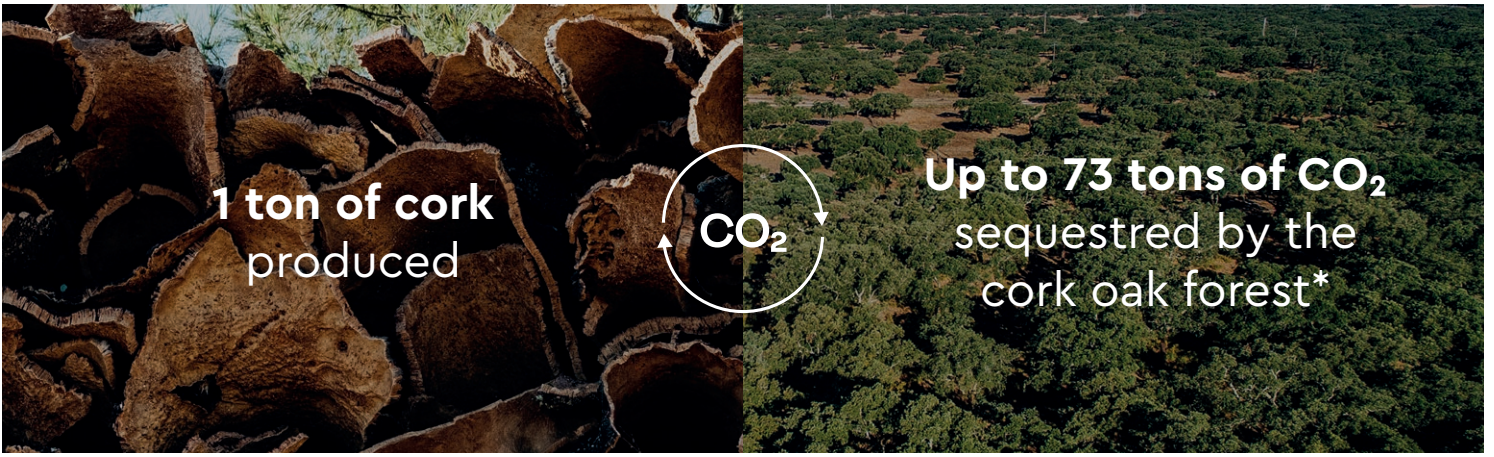

Good resilience
Excellent compressibility
and recovery

Extremely light

Natural, reusable
and recyclable

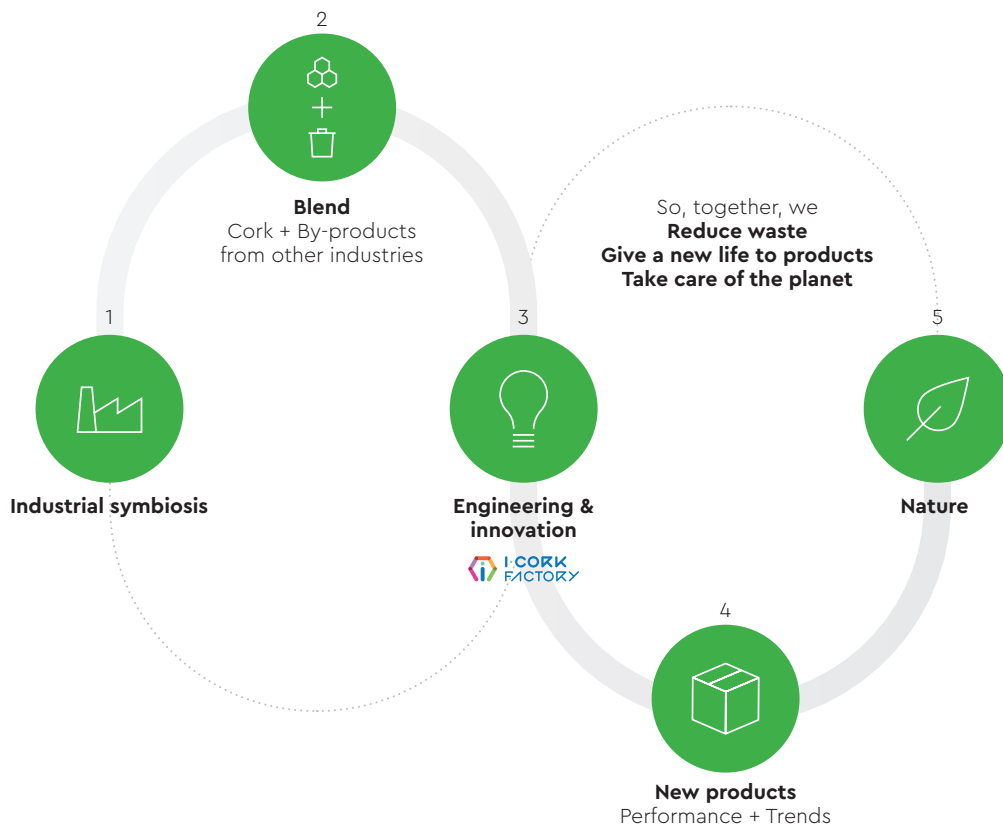

THE COMMITMENT TO CREATE A POSITIVE IMPACT ON THE PLANET

Cork products maintain the CO₂ storage capacity throughout their life cycle, which makes it possible to reduce the carbon footprint of various cork-based products.

With cork at the core, blended with other materials that are by-products from other industries (industrial symbiosis), we give materials a new life by creating new products leveraging cork's attributes while taking care of the planet.

At the i.cork factory, our innovation hub, we achieve the perfect match between performance and sustainability. New, innovative and high performance products from circular economy are arising.

WHY ACOUSTICORK?

Ensuring peace and quiet isn't a mere luxury. It's already a human need - to guarantee quality of life and work in our fast-moving era.

FAST-MOVING TIMES REQUIRE ACOUSTIC COMFORT

Growing urbanization and rising populations in urban areas are leading to more stringent noise and vibration standards and norms. As a result, is higher demand for high-quality and efficient sound insulation and vibration isolation (from internal or external sources in each building).

Every day, new buildings are being erected on plots of land subject to vibrations, in areas with dense infrastructures. Sources of disturbance are often located near railway lines, roads or industrial complexes. Unless appropriate action is taken, buildings are defenceless against such vibrations.

Many apartments blocks also have underground car parks, commercial establishments on the ground floor (such as a shopping mall) or even a gym on an intermediate floor. In these situations, various factors may subject buildings to shocks, which have an impact on their structure and are perceived by residents as noticeable vibrations or secondary airborne noise.

CORK INSIDE

When cork isn't so visible, this seal assures that cork is present in the optimal amount - guaranteeing the performance of the material.

Cork Inside formulations combine cork with other materials from other industries and are developed and rigorously tested by Amorim Cork Composite's innovation, quality and engineering teams. Cork Inside responds to stringent requirements and guarantees the needed performance required for the application.

ACOUSTICORK NATURAL BASE MATERIALS FOR DEMANDING APPLICATIONS

Amorim Cork Composites develops specific compound formulations, which offer highly insulation or damping materials in compliance with a wide range of environmental conditions.

Cork absorbs energy due to its unique compressibility and recovery characteristics, yielding higher loss factors that are essential for the damping function. Cork's extremely low Poisson Ratio improves the behaviour of such materials in dynamic loading applications. Cork also brings durability to the applied solution.

VIBRATION ISOLATION

Acousticork's specific material formulations for vibration control combine performance with environmental concerns.

Isolating the source of the vibration is essential not only to protect the quality of life of people in both the immediate location and those in the surrounding environment, it also helps to protect equipment from the long term degenerative effects of vibration.

Acousticork Vibration Control materials are engineered compounds of cork, natural and/or recycled rubber. Having high loss factors which are essential to the damping function - due to cork's closed cell structure filled with air, it dissipates vibration energy into low grade heat in each vibration cycle, resulting in a low amplification at resonance, giving our materials operational effectiveness in a wide range of frequencies.

CORK & NATURAL RUBBER ENGINEERED COMPOUND

Features

- ▶ Dynamic-to-static stiffness ratio (1,3-2,5)
- ▶ Low damping
- ▶ Low creep
- ▶ Low water absorption

Benefits

- ▶ Low resonance frequency
- ▶ Long term durability
- ▶ Can be used in mats, strips or pads and with different backings, such as double-sided tape

WORK LOAD RANGE [MPA]

RESIN BONDED CORK & RECYCLED RUBBER

Features

- ▶ Dynamic-to-static stiffness ratio (2-3,5)
- ▶ High damping
- ▶ Low Poisson ratio (no shape factor dependency)
- ▶ Recycled products

Benefits

- ▶ Lower amplification at resonance
- ▶ Long term durability
- ▶ Good Quality/Value ratio
- ▶ Can be used in pads

RESIN BONDED RECYCLED RUBBER

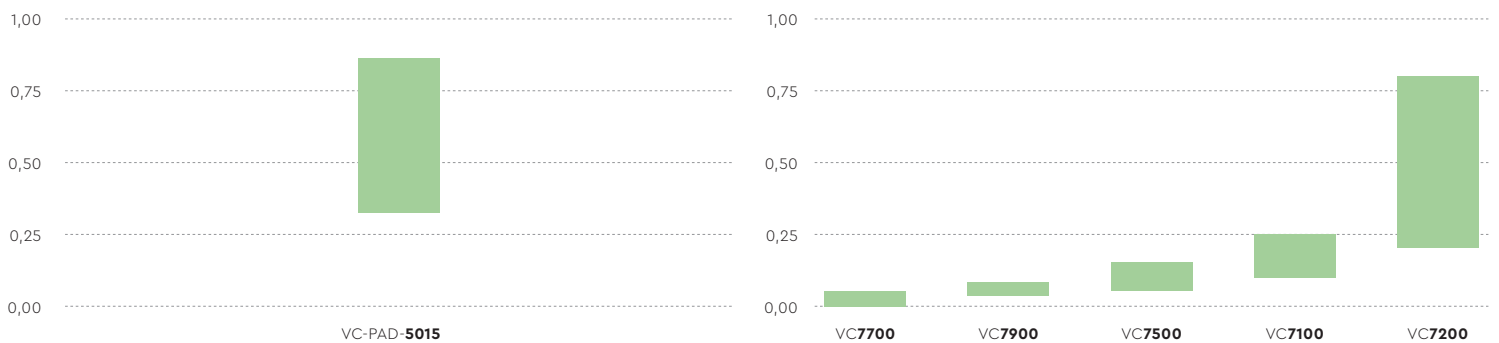

Features

- ▶ Dynamic-to-static stiffness ratio (2-3)
- ▶ Low damping
- ▶ Recycled products

Benefits

- ▶ Long term durability
- ▶ Good Quality/Value ratio
- ▶ Can be used in mats and strips

WORK LOAD RANGE [MPA]
